TROUBLESHOOTING

If the camera won’t turn on, it is probably out of batteries. Plug it into a USB port to recharge the battery.

If the video won’t play on a computer and shows up as a blank screen or an error message, your computer is probably missing the correct codec. Install the program that comes with the camera, the 3ivx codec will be installed as well. This codec is already installed on all the computers in the CTLT.

If the camera is completely dead and it seems that all is lost, there is a tiny black reset button hidden inside the tripod hold. This should revive the camera.
**BASIC USAGE**

To turn the camera on, locate the power switch next to the lens of the camera.

The camera should make a chirping sound and turn on when this button is pressed.

**Recording Video**

To start recording video, press the red button.

To stop recording, press the red button again.

You can record up to 60 minutes of footage at a time.

**PLAYBACK**

To view your video after you’ve recorded it, press the play/pause button above the red button.

If you have more than one video recorded, use the arrow keys to scroll through the videos, then press the play/pause button to watch them.

To control the volume during playback, use the +/- arrows located above and below the red recording button:

To delete a video, select it using the arrow keys, then press the trash-can icon. Scroll over to ‘Yes’, and then press the play/pause button to delete the video.

**CONNECTING TO THE COMPUTER**

To reveal the Flip camera’s USB connector, locate the switch on the side of the camera opposite the on/off button.

The USB connector should pop out on the top. Once it does plug it into a USB port on your computer.

On a Mac, allow iPhoto to open the camera and import video using that program.

When you disconnect the Flip camera from your computer, remember to use the ‘Safely Remove Hardware’ feature if you are using a PC, and eject the device from the desktop if you are on a Mac.
